

This login page is designed for the **USAT College Archiving System**, providing a secure and user-friendly way for users to access the platform. It features a clean interface with fields for username and password, along with a "Login to Dashboard" button. Also, includes options for password recovery and demo credentials for testing, making it both functional and accessible for SAS and staff.

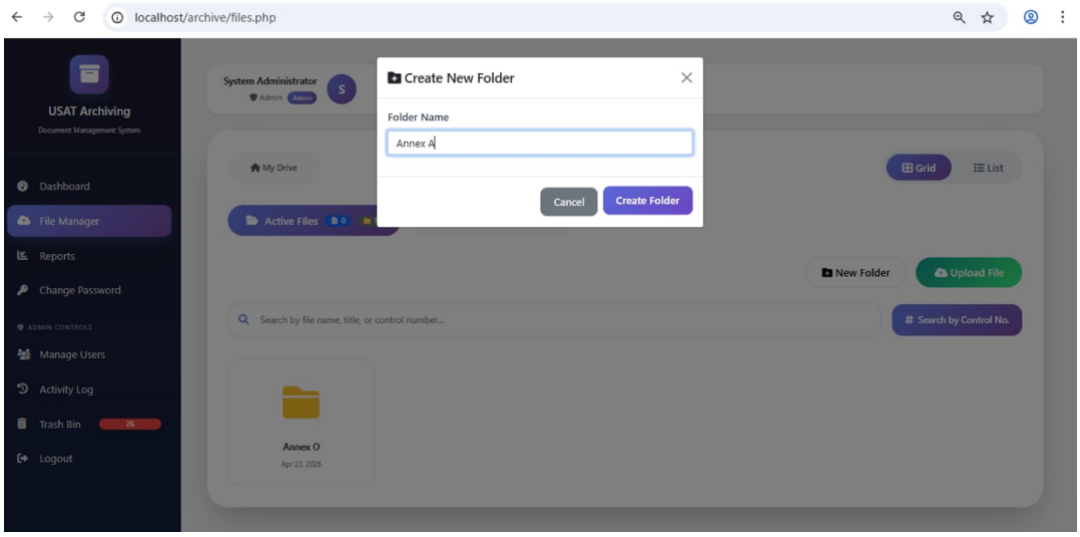

This dashboard page serves as the main control panel of the **USAT Archiving System** for the system administrator. It provides a clear overview of system activities, including total documents, folders, archived records, beneficiaries, and staff members. The interface includes a sidebar for easy navigation to features like file management, reports, user management, and activity logs. At the top, a welcome banner displays the current date and time, along with system status updates. Overall, the dashboard is designed to help staff efficiently monitor, manage, and organize archived documents in one place.

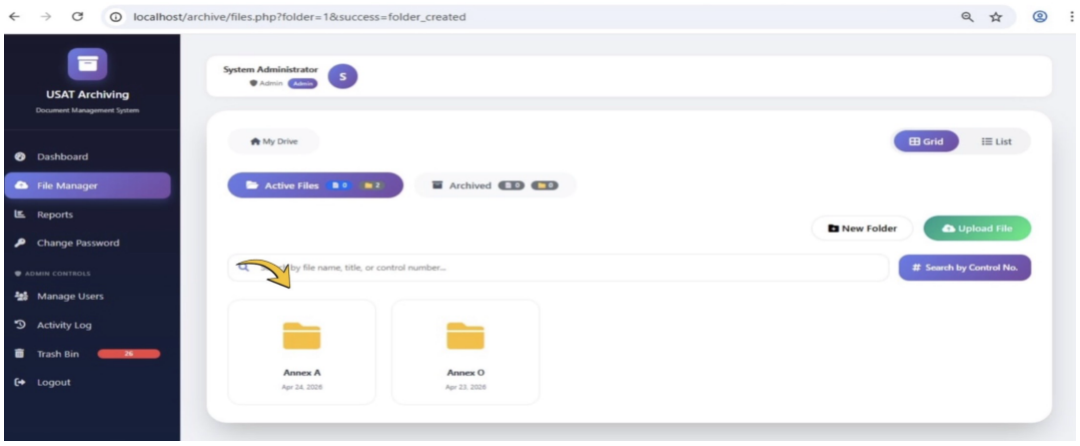

The user can view and organize files using either a grid or list layout. There are tabs for Active Files and Archived items, along with options to create a new folder or upload files. A search bar allows users to find documents by name, title, or control number. The display currently shows a folder named “Annex O,” indicating stored files within the system.

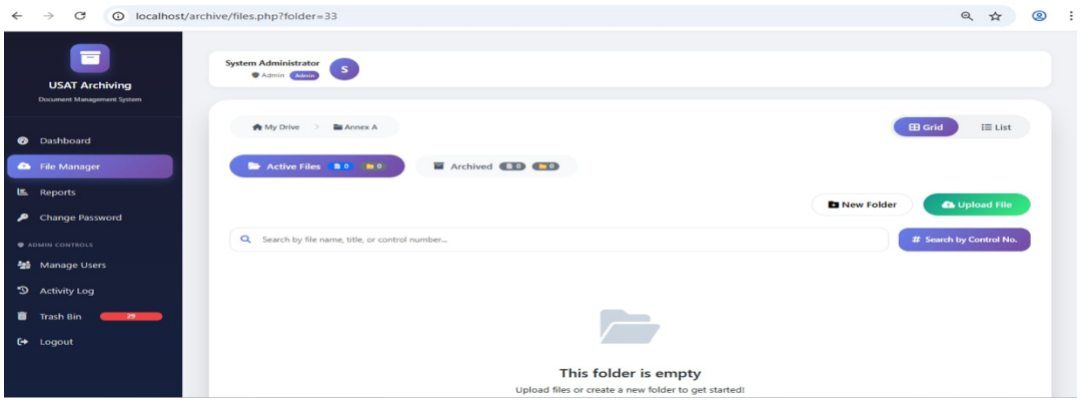

If you want to add Another Annex, just click the new folder.

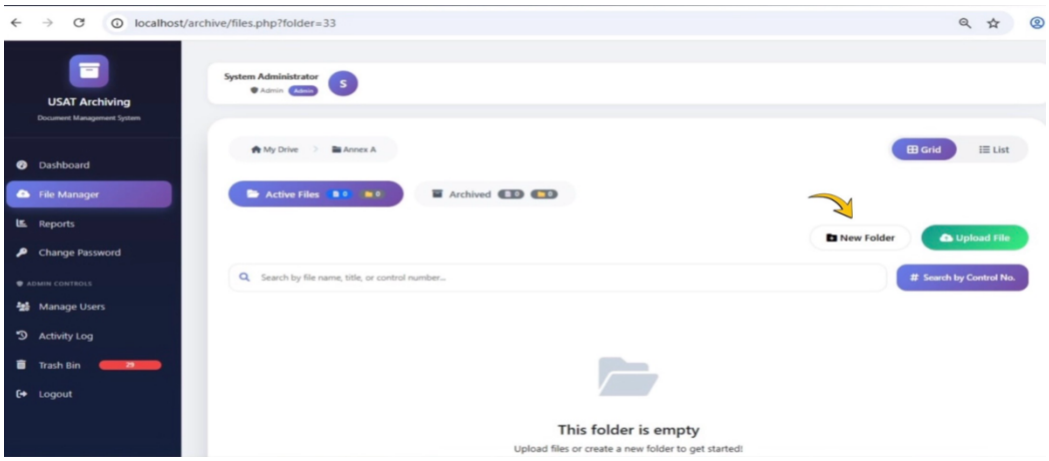

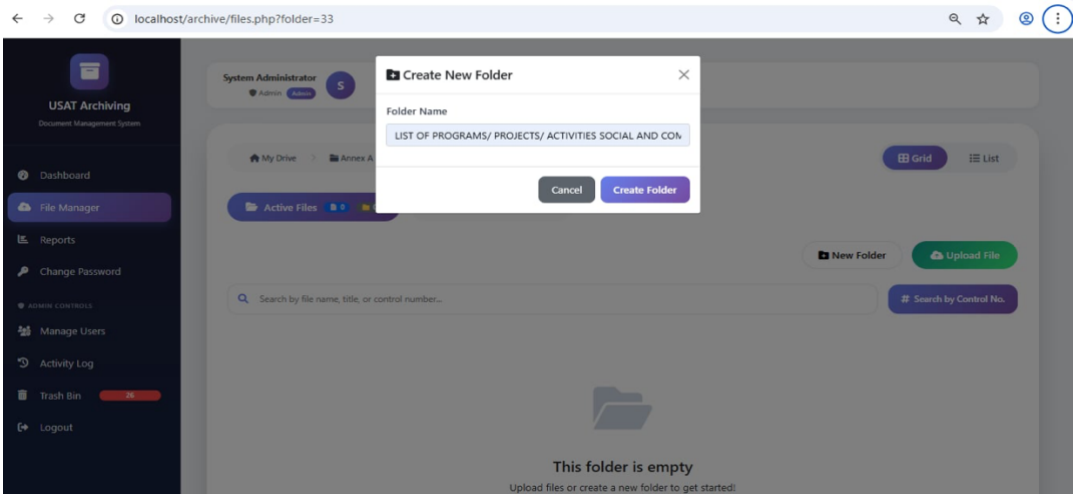

Then, you can put the name of the annex that you want.

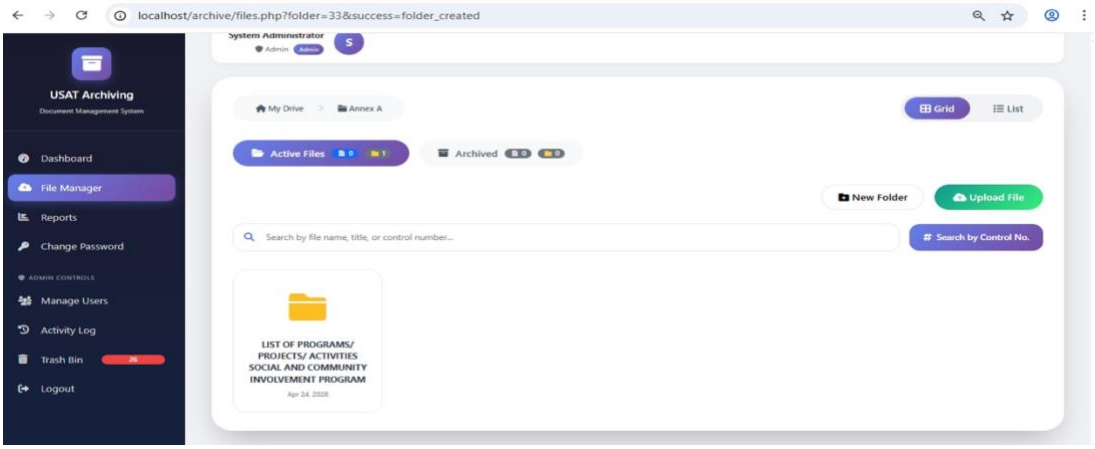

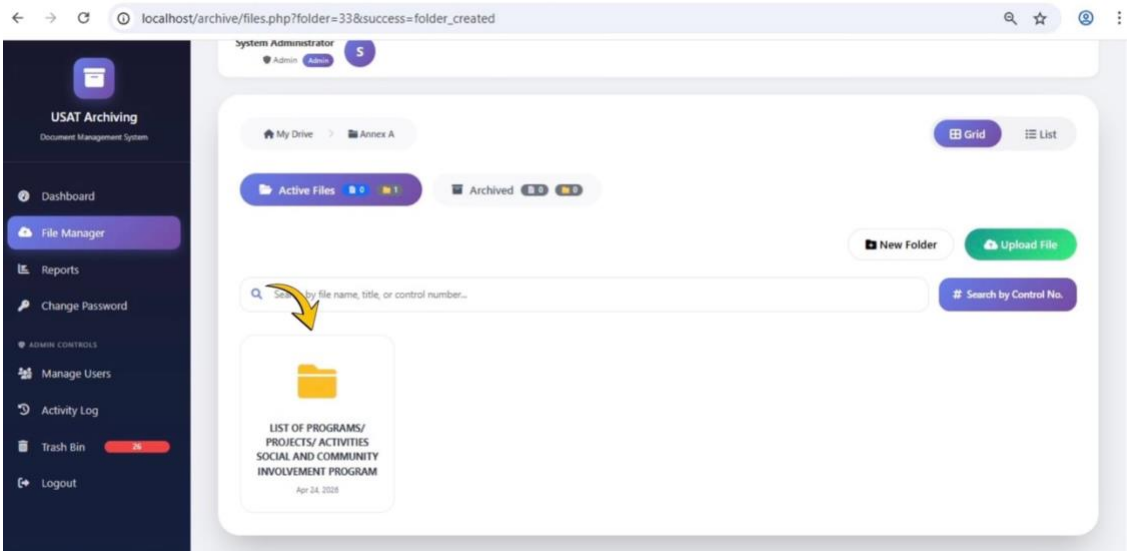

In the first image, navigating into the folder marked 'Annex A' leads directly to the screen shown in the second image, confirming that the folder is currently empty.

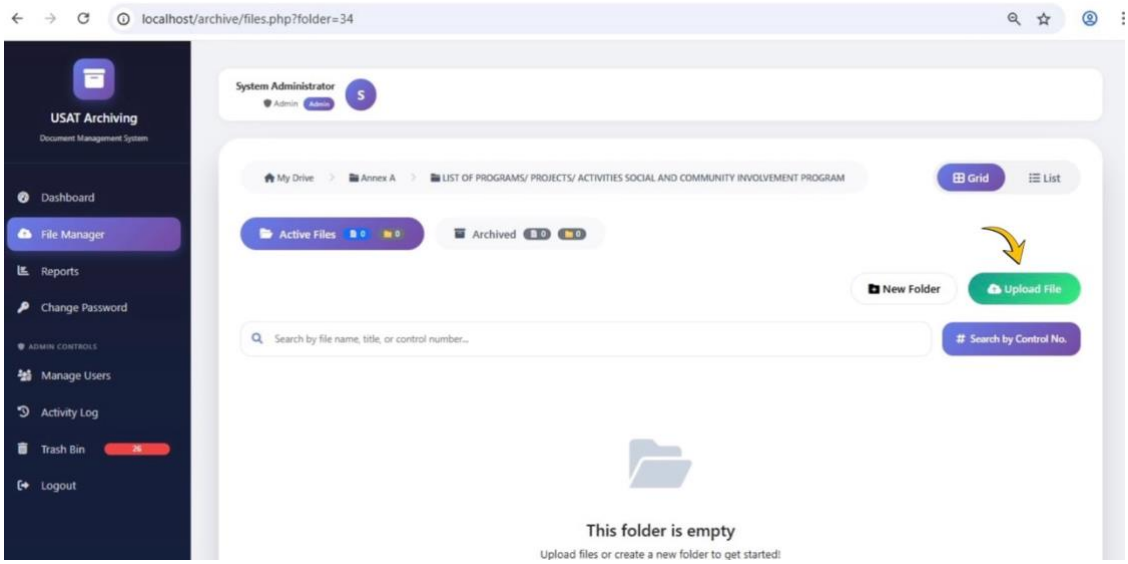

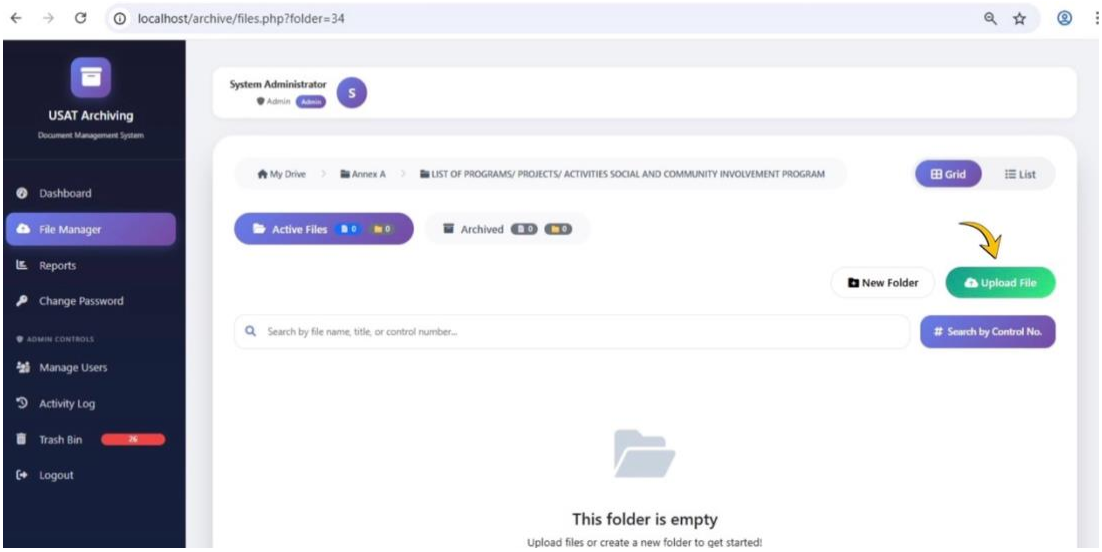

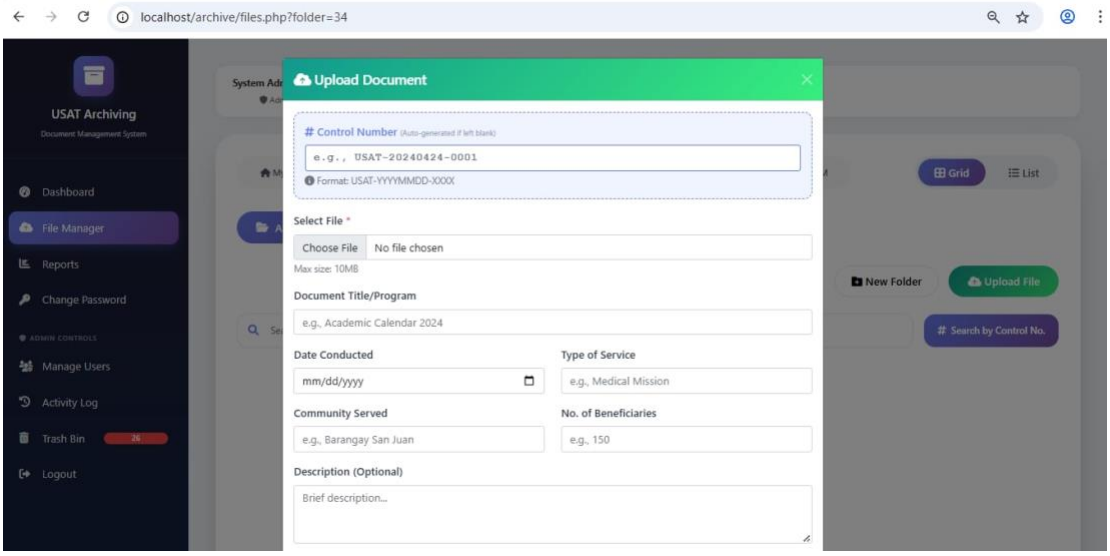

In the first image, the arrow points to the 'New Folder' action, which opens the creation modal seen in the second image. Once the user clicks 'Create Folder,' the third image displays the new folder that you made.

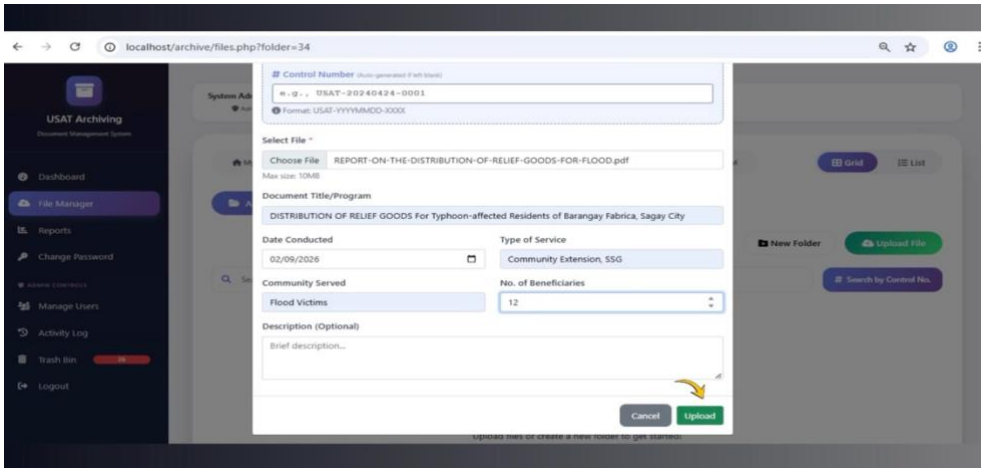

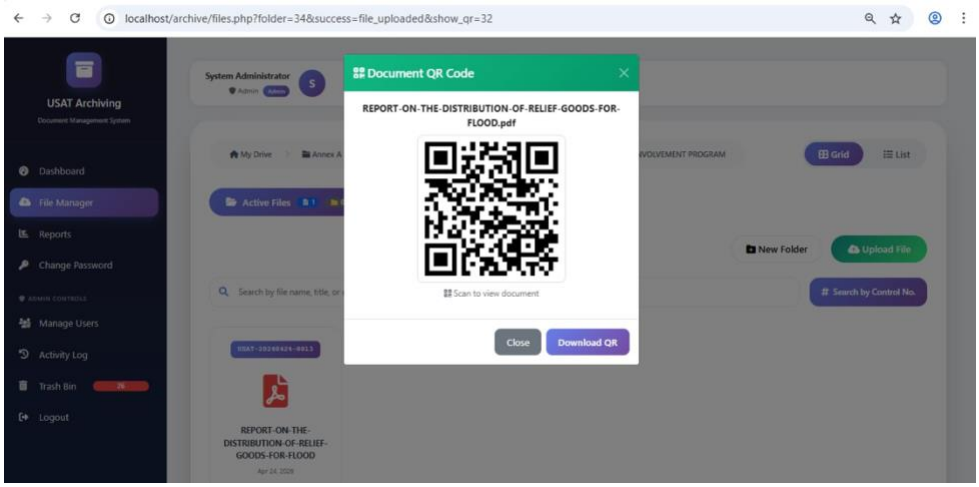

By clicking the folder icon in the first picture, the interface transitions to the view in the second picture, allowing you to begin uploading files.

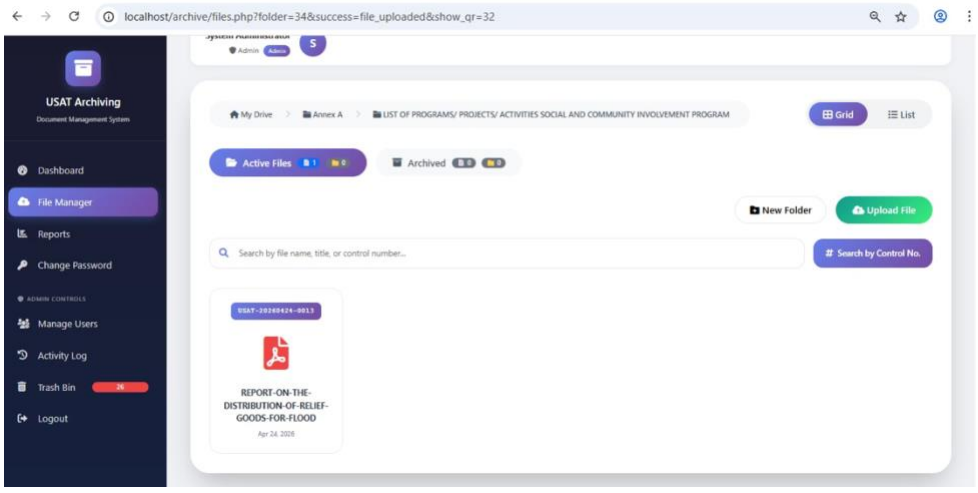

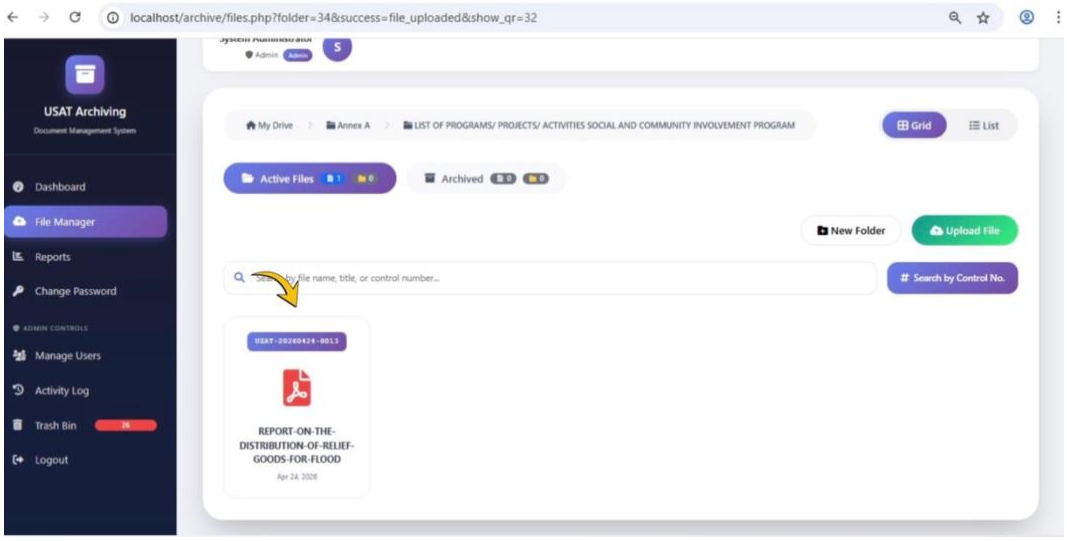

Once you click the upload button in the first picture, the system displays the pop-up modal shown in the second picture, allowing you to choose a file and fill in the required project information.

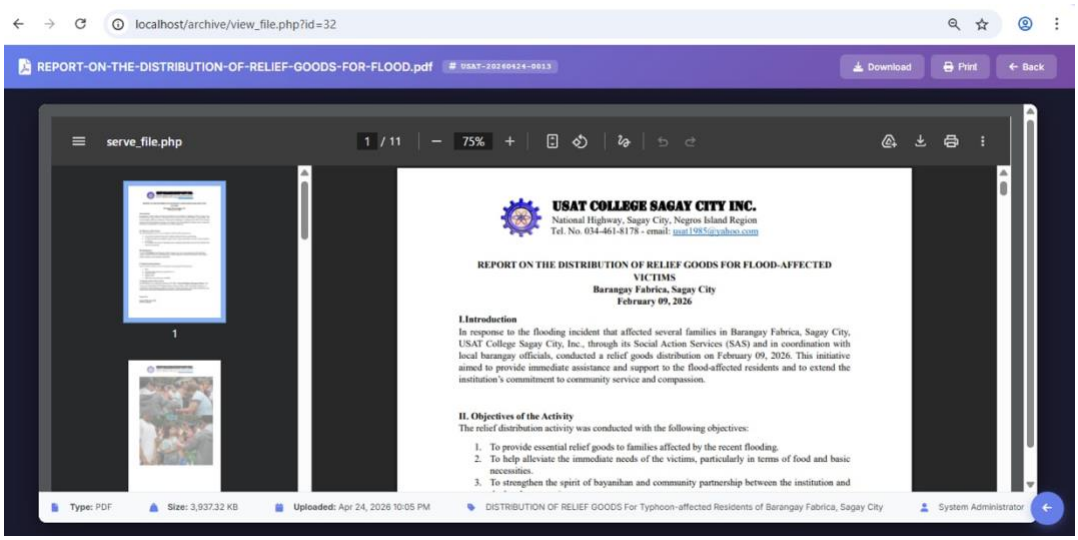

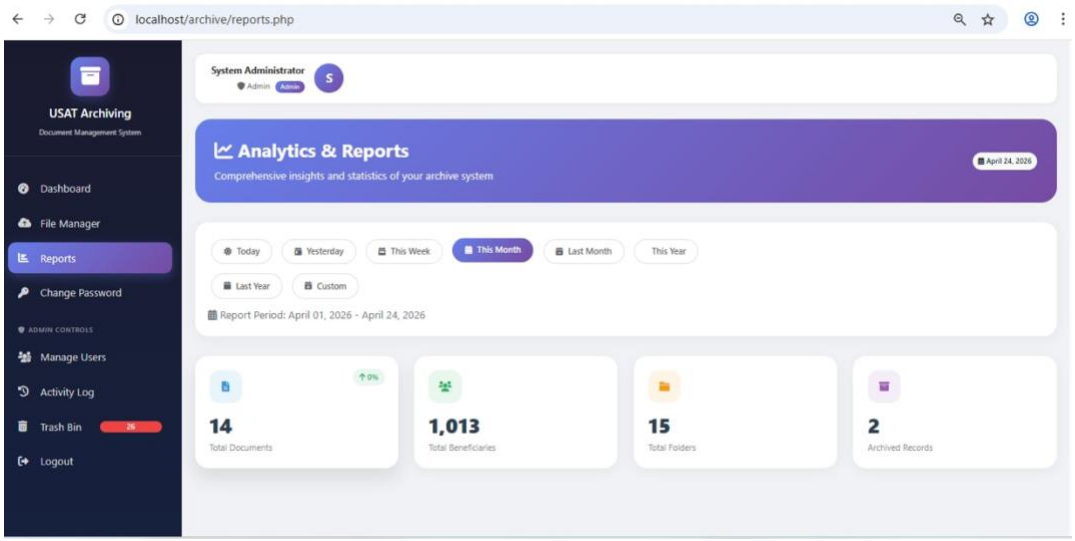

After clicking the upload button in the first picture, the system provides a QR code for easy access as seen in the second picture; just close the QR window. Then, the third image shows the final result with the PDF file successfully archived in the system.

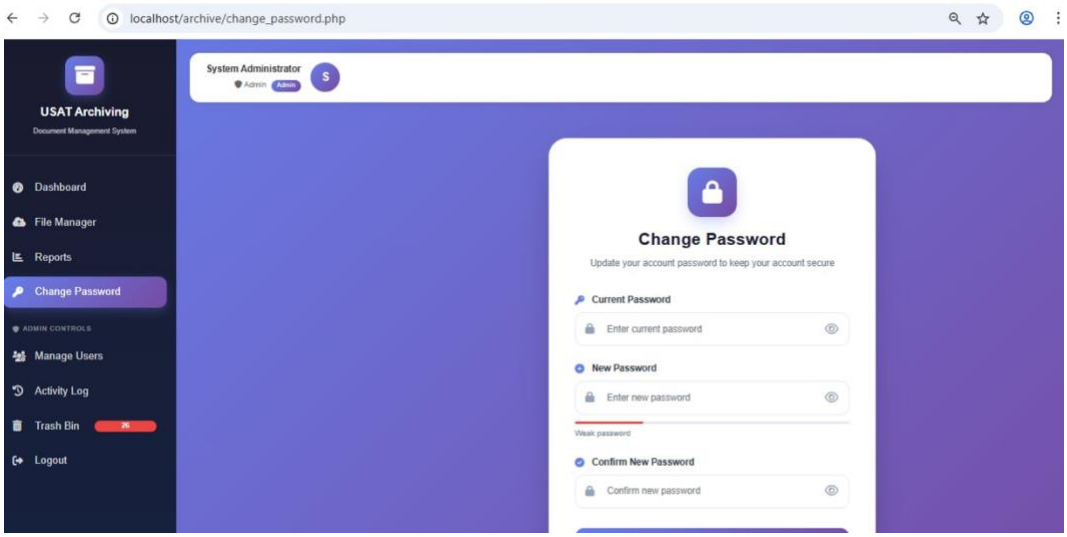

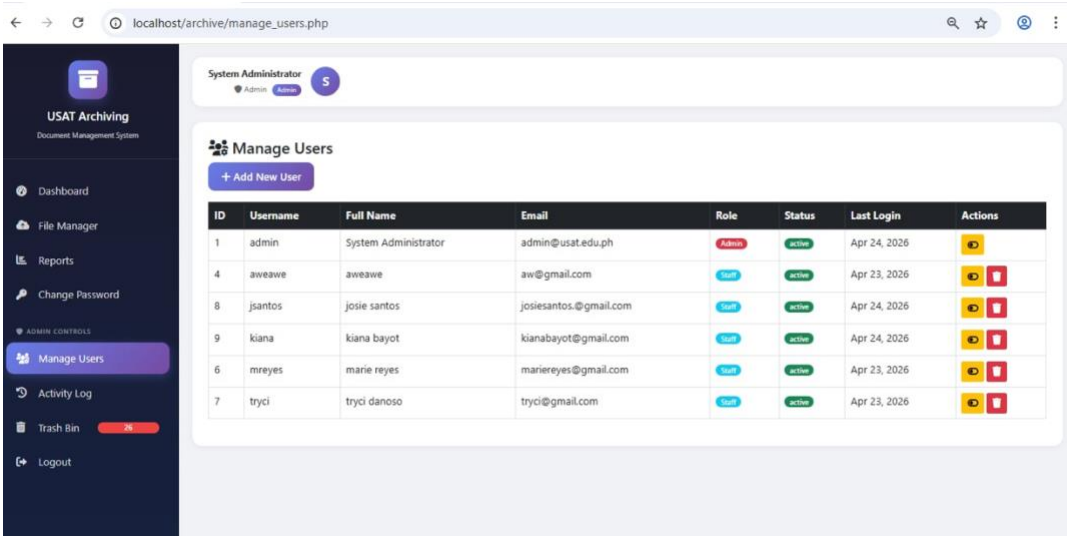

By clicking on the document in the first picture, you are taken to the screen in the second picture, allowing you to view, download, or print the specific report.

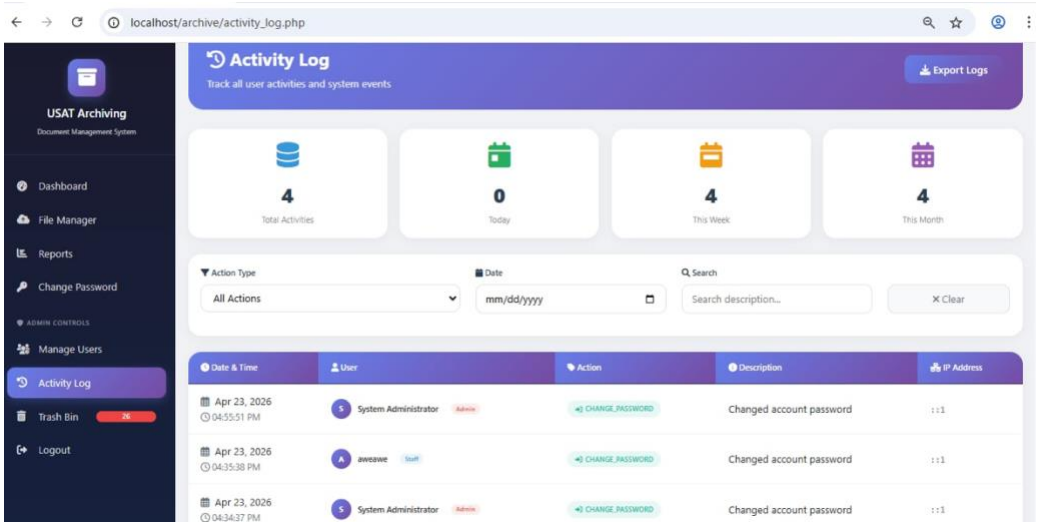

The image displays the reports page where users can filter data by different time periods, such as 'This Month', to see total documents, beneficiaries, and folders at a glance.

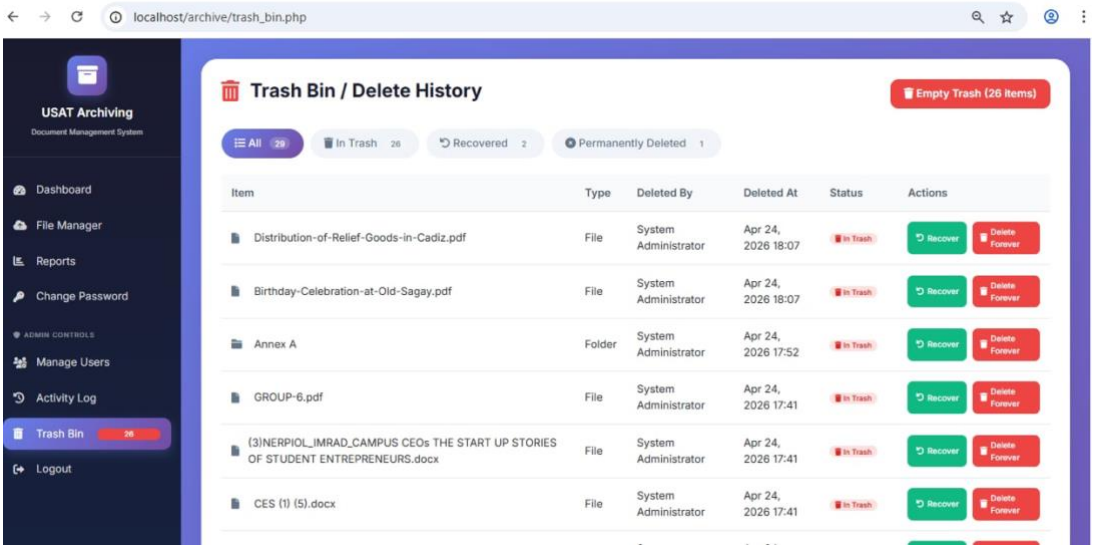

This picture displays the Change Password page, where the system administrator can update their login credentials to keep the account secure.

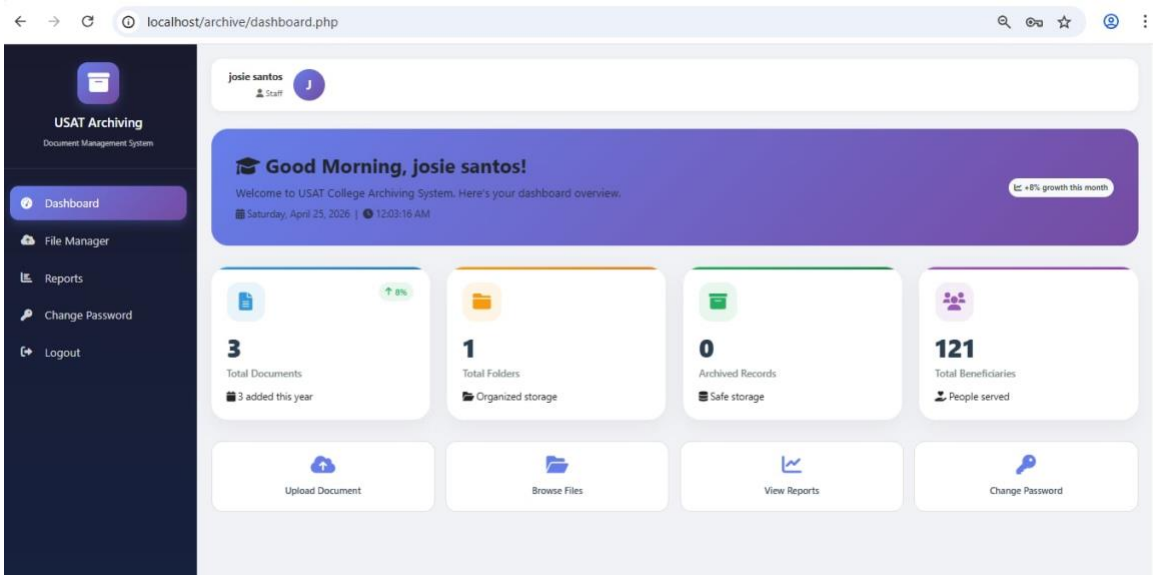

The image shows the Manage Users screen, where administrators can view a complete list of registered accounts, their roles, and their current activity status.

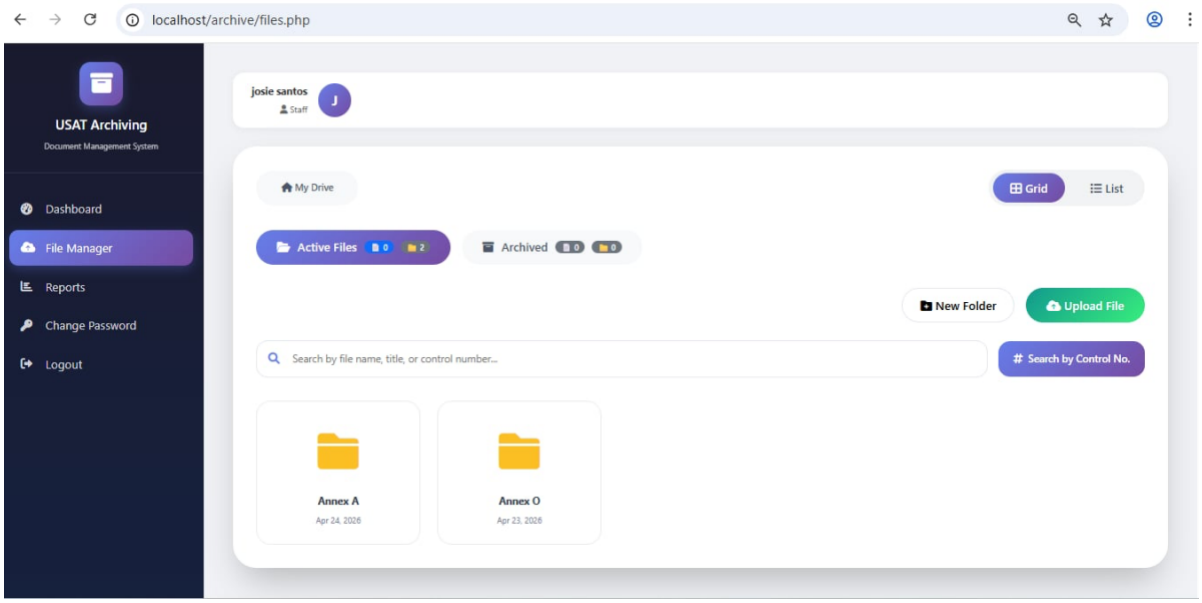

On this screen, administrators can monitor security and usage by filtering through Action Types or specific dates to see exactly what changes were made within the archiving system.

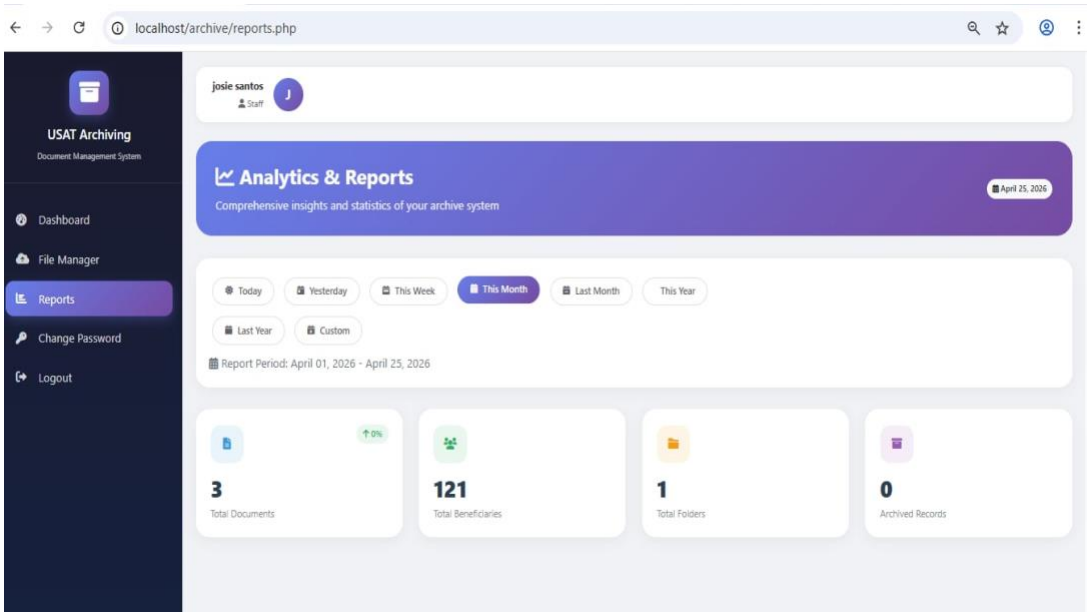

The final image in your sequence displays the Trash Bin / Delete History section of the USAT Archiving system. This page serves as a safety net for managing deleted content and maintaining a clear audit trail of removed data.

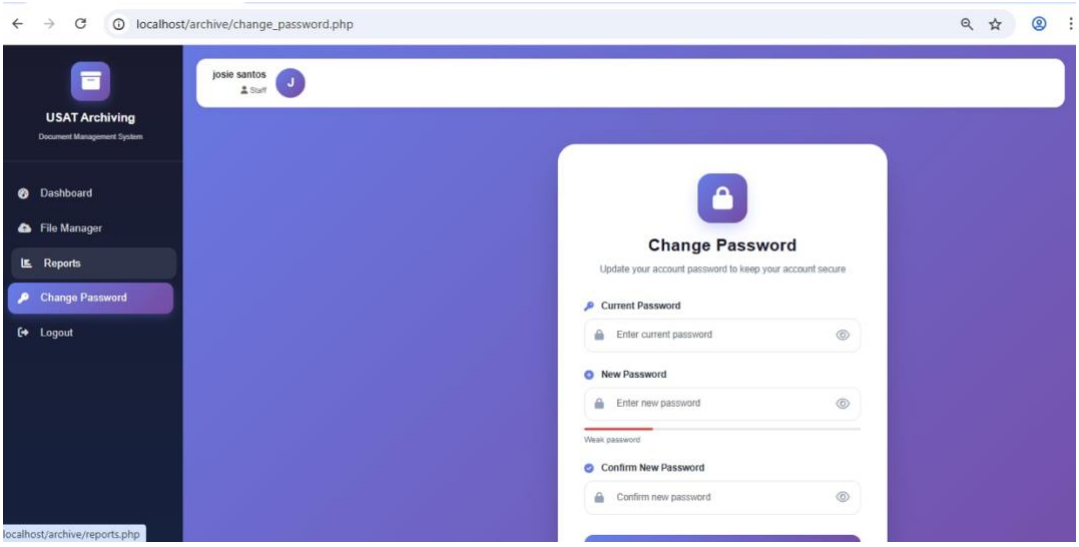

The first picture shows the main dashboard for the staff; it looks almost the same as the admin's, but notice the sidebar is simplified.

The second picture shows the file manager; it's the same as the admin view, but staff can’t delete any of the uploaded documents and can’t rename them—only the admin can do that.

The third picture, the staff member selects a folder to navigate deeper into the drive, similar to the admin's workflow.

The fourth picture shows the contents of that folder; even though it looks like the admin's view, the system enforces restricted permissions so staff can only view or upload, not modify what is already there.
